#### OPERATOR OPTIONS

Options of the Sprint One<sup>™</sup> game offer maximum player appeal for each game location. These options are listed in Table 1. They are preset for a certain game structure during production. To determine how the switches have been set for your game, compare the TV monitor viewing screen during the attract mode with the information in Table 1.

In order to change the toggle positions of the switch assembly and set the desired options, the printed circuit board (PCB) must be removed according to the following procedure:

- 1. Unplug the game. Unlock and open the rear access door.
- 2. Locate the RF box immediately inside the cabinet on the right. (It is an aluminum box with small holes.) On one end of the box is a printed circuit board with an edge connector coming from the edge of the board. This printed circuit board is the RF shield assembly.
- Remove the five pan-head Phillips screws from each of the long sides (total of ten screws) of the RF shield assembly.
  - IMPORTANT: To prevent damage to the capacitors on the rear side of this PCB, move the board about 1/4" towards the edge connector (same direction as two arrows on small white label). Then pull the RF board out towards yourself. Never yank the RF board straight out of the metal box.
- 4. Carefully remove the PCB from the RF shield assembly.
- 5. Set the switches for the desired options, as shown in Table 1.
- 6. Reinstall the PCB following Steps 1 through 4 in reverse order. Do not force or bend the printed circuit board. Before reinstalling, always inspect the printed circuit board for damage. Close and lock the rear access door.
- 7. Plug in the game and verify option functions by playing it.

Table 1 Operator Options

## SELF-TEST PROCEDURE

The self-test procedure permits you to check the TV monitor, the character-generating and sync circuits, and the controls. It speeds up troubleshooting by quickly isolating many kinds of component problems. This feature tests about 95% of the game's circuitry. The tests, except for the switches, are done automatically when the self-test switch is turned on. The results of each test are displayed sequentially on the TV monitor until the self-test switch is turned off. High scores will reset to 000 when performing the self-test, we suggest that you run the self-test each time the coin box is emptied.

Table 2 Self-Test Procedure

Test	Instruction	Results if Test Passes	Results if Test Fails
1	Unlock and open coin door. Set self-test slide switch (located inside and to the left of the coin door), to the "on" position.	TV monitor "flashes" alpha- numerics (A through Z, and 0 through 9) on the screen, while audio "hash" sound comes from speaker. Rotating car appears in the lower right-hand corner of the screen and moves diagonally toward upper left-hand corner. When the car reaches the upper left corner of the screen, RAM test is complete.	TV monitor display freezes.  NOTE TO TECHNICIAN  The TV monitor display freezes, with a letter or number showing on the screen. This letter or number corresponds to the alphanumeric whose particular data code was not written into the RAM correctly.
		If RAM testing is satisfactory, self-test feature automatically begins the ROM test.(Test 2.)	

Table 2 Self-Test Procedure

Test	Instruction	Results if Test Passes	Results if Test Fails
7	No operator action required.	Self-test operator sees a visual representation of game structuring in white characters at the top of the screen. No other visual effects appear on the screen.	Black numbers appear in the center of the screen. Refer to Table 3 to determine the failing ROM locations on the PCB. Match the part number of the game's PCB with the part number in Table 3.
m	Set gear shifter in 4th position then shift into 1st, 2nd, and 3rd positions. Step on accelerator foot pedal. Press START button. Trip right and left coin acceptor wires.	For each position, except 4th gear, an audio screech sound occurs.  Audio screech sound occurs each time foot pedal is depressed.  Audio screech sound occurs each time START button is pressed.  Audio screech sound occurs each time wires are tripped.	A constant screech sound indicates a stuck switch or a shorted harness. No screech sound indicates a broken switch or an open harness.
4	No operator action required.	Light-emitting diode for START button activates automatically and stays on.	Light in START button is not activated.
